Supplementary Information

Evaluating synthetic clinical data for future realizations and hospitals

This R2 Supplement preserves the 309-page display-normalized V2 publication baseline, adds historical main figures as Supplementary Figures S2–S6, retains E1 and E3 tables, and supplies complete oversized records as Supplementary Data 1–10. Original numerical values are unchanged.

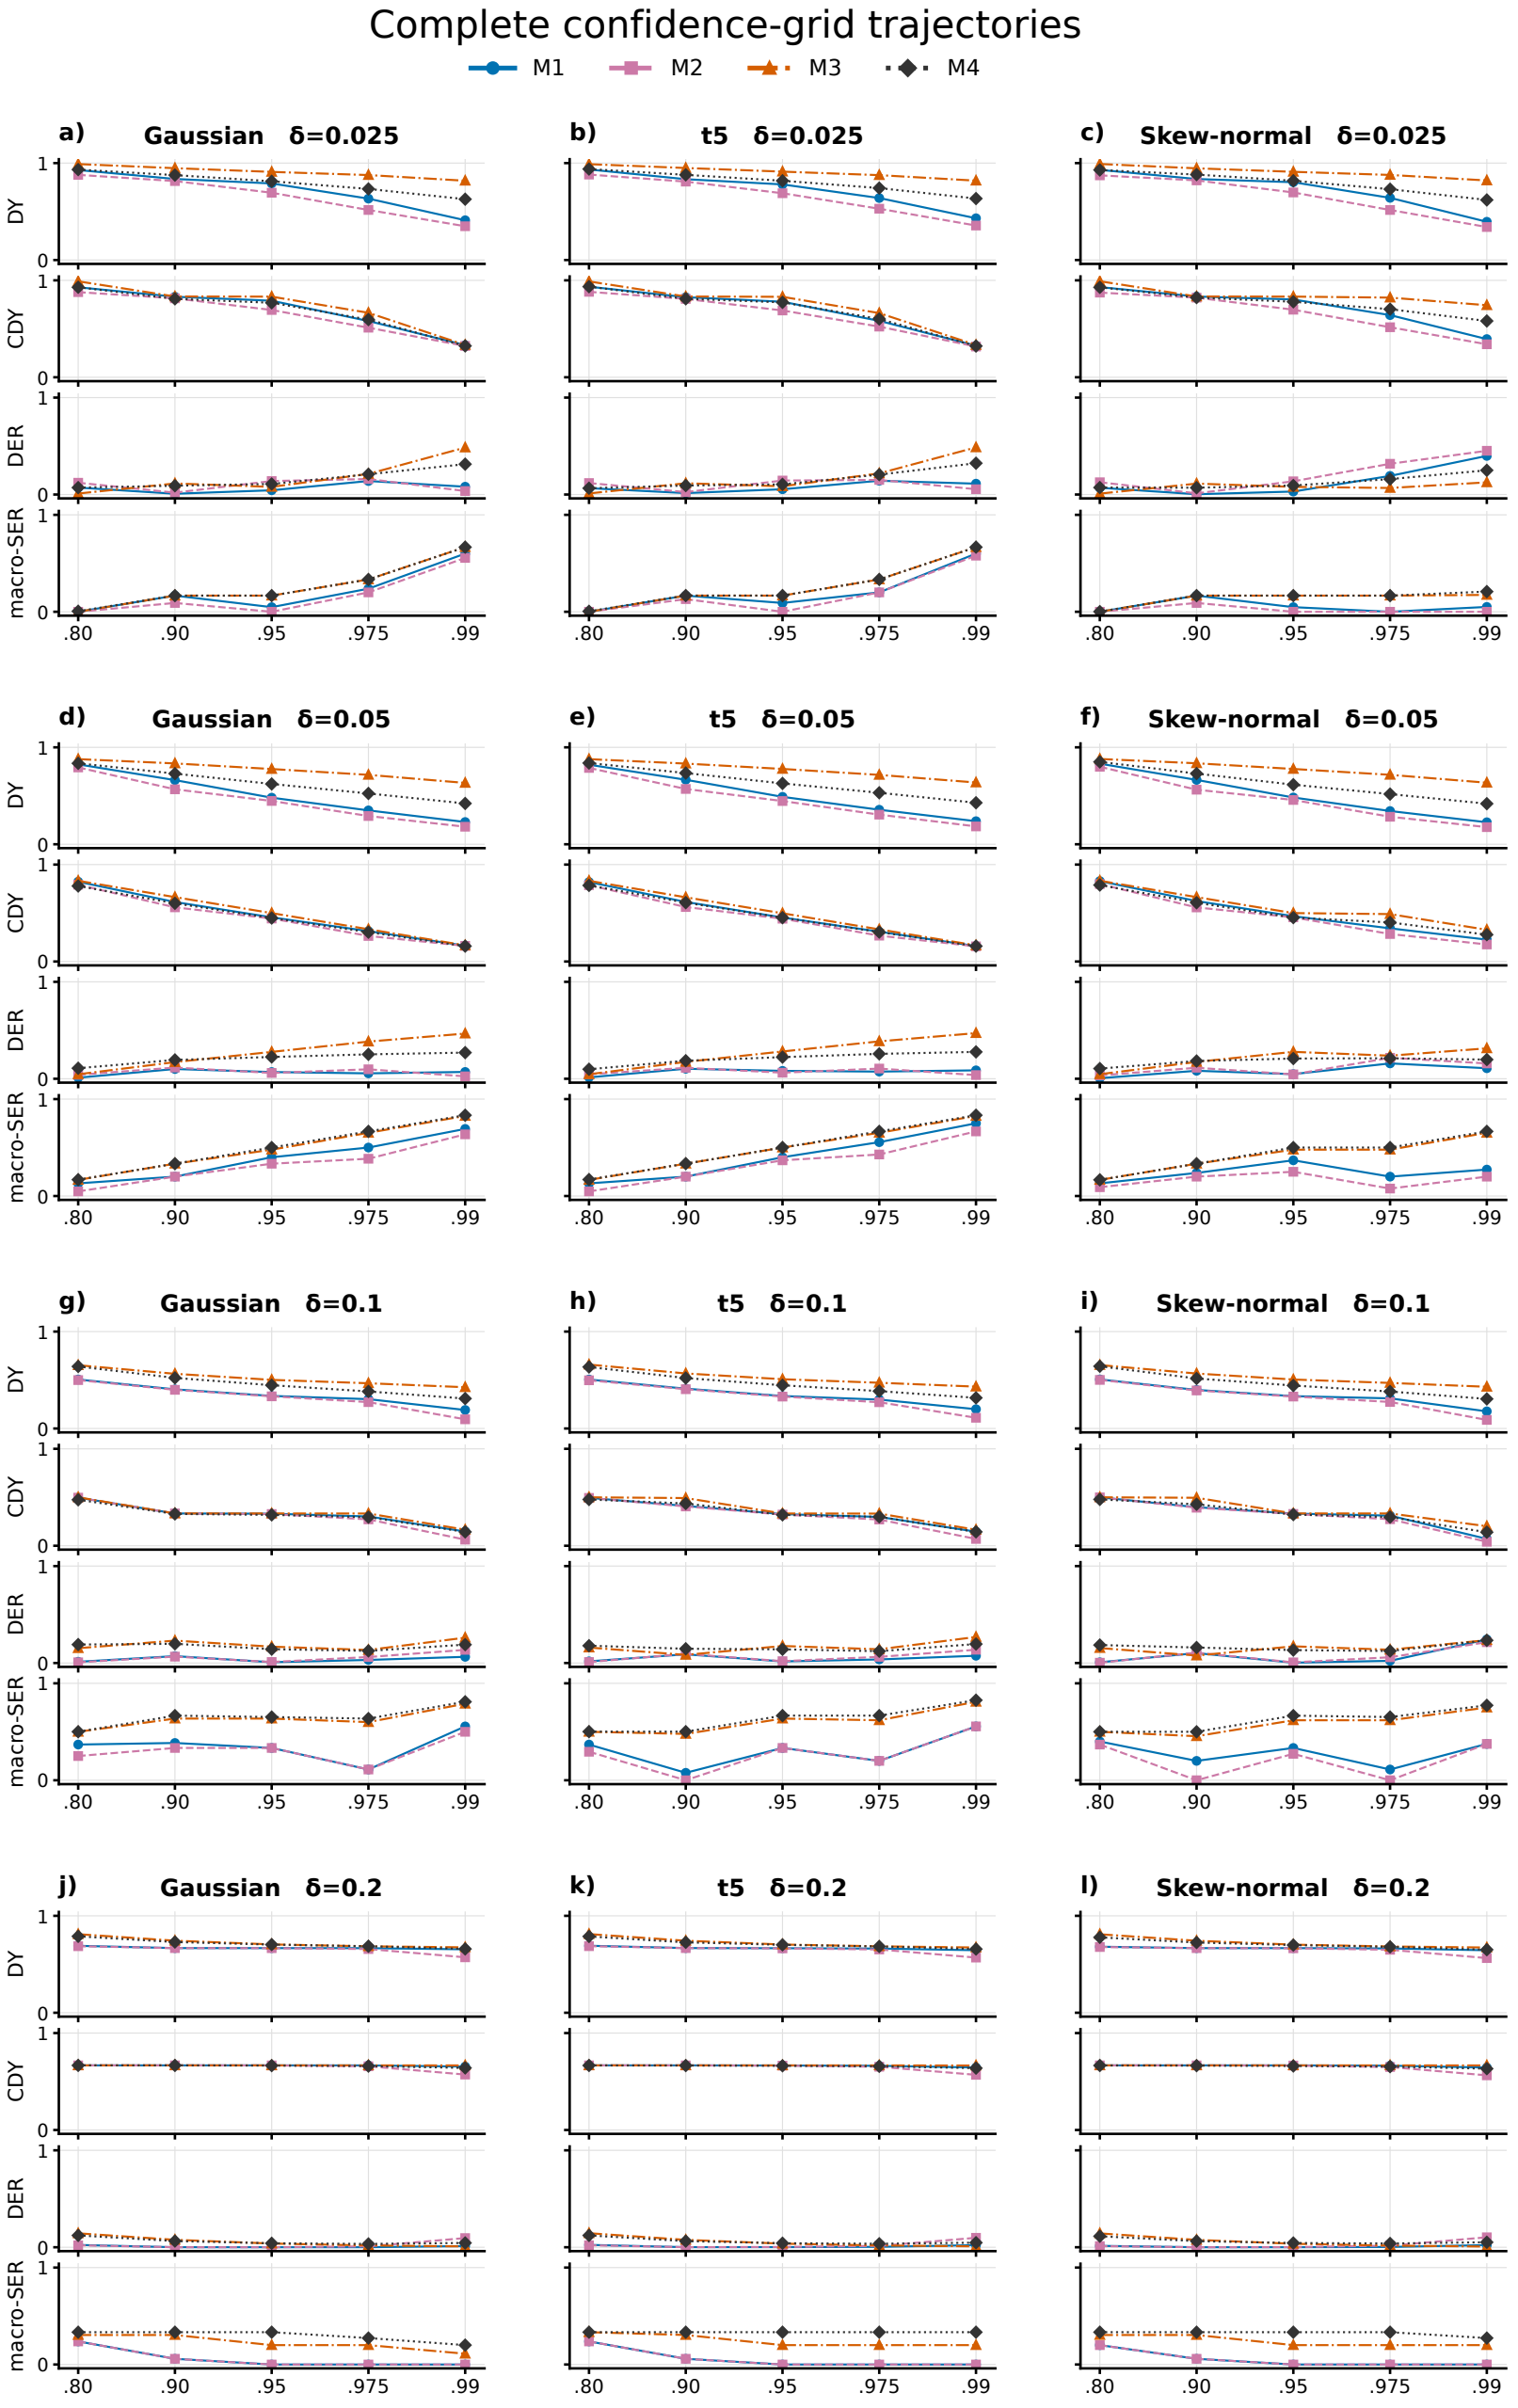

Navigation

Box S1 and Supplementary Figure S1: original V2 explanatory material and confidence-grid trajectories.
Supplementary Figures S2–S6: historical V2 main figures displaced by the R2 main display hierarchy.
Supplementary Tables S1–S18: original V2 numerical and methodological records.
Supplementary Table S19: E1 empirical baselines and classifications.
Supplementary Tables S20–S22: E3 cost grid, illustrative regret, classifications, and P95 sensitivity.
Supplementary Data 1–10: complete E1, E3, and E5 machine-readable records.

Evidence boundary

E1 empirical comparisons have no truth oracle. E3 costs are methodological and conditional on original scenario truth positions. E5 comparisons are dependent exploratory contrasts without multiplicity adjustment. E2 was not completed and E4 was not executed.

Supplementary Figure S1 Complete confidence-grid trajectories

Confidence c (equally spaced categories). All 240 profiles; four metrics per profile.

Each trajectory fixes DGP, tolerance and strategy. Numerical values: Table S7.

DY, CDY, DER and macro-SER are displayed at c=0.80, 0.90, 0.95, 0.975 and 0.99 for all 3 distributions × 4 fixed tolerances × 4 strategies (240 profiles). Lines connect only confidence settings within a fixed distribution, tolerance and strategy; horizontal positions are equally spaced confidence categories. M1 uses full sampling covariance in a crossed realization–hospital model; M2 retains its diagonal; M3 aggregates repeated realizations before hospital inference; M4 uses one realization across hospitals. DY and CDY use all successful fits within each cell; macro-SER conditions on definitive decisions and averages only over cells with positive definitive counts. The policy-matched oracle is retained at each confidence. P95 remains primary. These related scenarios are not independent studies. Numerical values are reported in Table S7. Main Figure 5a displays the c=0.99 minus c=0.80 endpoint changes. Panels a–l identify distribution–tolerance groups, ordered left to right within each tolerance block; within each group, the four metric rows retain their labels.

Supplementary Figure legends

Supplementary Figure S2 — Study architecture and evaluation-strategy ladder

a, Clinical data sources and evaluation roles. MIMIC-IV provides training and held-out internal evaluation, SICdb provides external evaluation, and eICU-CRD provides multicenter external evaluation and the hospital populations used for future-hospital inference. b, Repeated synthetic-data generation and learner evaluation produce a hospital-by-realization matrix of external utility loss (EUL), defined as destination AUROC for the real-trained model minus that for the corresponding synthetic-trained model. c, Target B represents latent utility loss for a new utility-estimable realization at a future eligible exchangeable hospital; Target A averages over the realization distribution. d, M1 uses full sampling covariance in a crossed realization–hospital model; M2 uses only its diagonal; M3 aggregates repeated realizations before hospital inference; and M4 evaluates one realization across hospitals. M3–M4 and M2–M3 compare broader evaluation strategies. M1–M2 is the cleanest component comparison because the strategies share crossed structure and realization information while differing in their treatment of off-diagonal sampling covariance. M1–M4 compares complete strategies. Arrows indicate strategy relationships and do not imply causal component effects. denotes the within-hospital sampling-covariance matrix.

Supplementary Figure S3 — Decision profiles across evaluation strategies

Each point shows definitive yield (DY; horizontal axis) and decision-error rate (DER; vertical axis), equally averaged across template–regime cells. Columns show Gaussian, variance-matched Student , and skew-normal heterogeneity; rows correspond to , 0.05, 0.10, and 0.20. All 48 strategy profiles are displayed. M1 uses full sampling covariance in a crossed realization–hospital model; M2 uses only its diagonal; M3 aggregates repeated realizations before hospital inference; and M4 evaluates one realization across hospitals. Under the primary P95 policy, Target-B utility loss is classified as QUALIFIED when , NOT QUALIFIED when , and INDETERMINATE otherwise. Here, is the prespecified AUROC-loss tolerance. Target B represents latent utility loss for a new utility-estimable realization at a future eligible exchangeable hospital; Target A averages over the realization distribution. Open circles, squares, triangles, and diamonds identify M1, M2, M3, and M4, respectively; marker sizes differ only to improve visibility of nearly overlapping points. Lines do not connect different tolerances. DER counts all three-state disagreements with the policy-matched oracle, whereas DY counts estimated QUALIFIED or NOT QUALIFIED decisions. Correct definitive yield and unconditional false qualification are reported in Table 2. These absolute profiles are descriptive rather than formal paired contrasts. Panels a–l are ordered from left to right within each tolerance row.

Supplementary Figure S4 — Paired strategy contrasts

a, M3–M4 repeated-realization information strategy contrast. b, M2–M3 crossed-structure strategy contrast. c, M1–M2 full-covariance component contrast. d, M1–M4 complete-strategy contrast. M1 uses full sampling covariance in a crossed realization–hospital model; M2 uses only its diagonal; M3 aggregates repeated realizations before hospital inference; and M4 evaluates one realization across hospitals. All panels use the primary P95 policy at confidence 0.95 for Target B and include all three heterogeneity distributions and four tolerances (, 0.05, 0.10, and 0.20). Points and whiskers show paired differences and 95% Monte Carlo intervals. Open markers identify intervals containing zero, including degenerate zero intervals; dashed vertical lines mark zero. Signs are defined as comparison minus reference. Positive values indicate higher values of the corresponding metric: DER, DY, correct definitive yield (CDY), or false qualification among all successful fits (FQ-all). Lower error and greater decisiveness represent distinct decision objectives. Each estimate equally weights contributing template–regime cells and uses the within-cell pairwise common-success set; exact denominators are reported in Table 3. Monte Carlo intervals quantify simulation uncertainty. Distribution-by-tolerance settings represent related scenarios rather than independent studies.

Supplementary Figure S5 — Coverage architecture

All 576 distribution-by-template-by-regime-by-strategy-by-target coverage cells are displayed. M1 uses full sampling covariance in a crossed realization–hospital model; M2 uses only its diagonal; M3 aggregates repeated realizations before hospital inference; and M4 evaluates one realization across hospitals. Target B represents latent utility loss for a new utility-estimable realization at a future eligible exchangeable hospital; Target A averages over the realization distribution. Coverage is the proportion of successful fits whose nominal 0.95 predictive interval contains an independently generated latent future target. The common scale spans the observed range from 0.500 to 1.000; numerical values are not printed within cells. Exact cell values, interval widths, pointwise Monte Carlo intervals, and fitted-to-true variance diagnostics are reported in Supplementary Table S5. Dashed cell outlines indicate coverage below 0.90 and solid outlines indicate coverage above 0.99. These thresholds are descriptive concentration thresholds rather than inferential calibration cutoffs. R1, realization-dominant; R2, hospital-dominant; R3, interaction-dominant; R4, mixed. LR denotes L2-penalized logistic regression. For Target B, M3 and M4 intervals do not include the full realization and realization-by-hospital variability specified by the target. Panels a–c show Gaussian, variance-matched Student , and skew-normal heterogeneity, respectively.

Supplementary Figure S6 — Decision-stringency sensitivity

a, Changes in DY, CDY, DER, and macro-averaged selective error (macro-SER) from to . Values are calculated as the metric at minus the metric at ; dashed vertical lines mark zero. Each point represents a fixed distribution, tolerance, and strategy. Small vertical offsets separate overlapping strategy symbols and carry no quantitative meaning. All 48 endpoint-change records are displayed for each metric, without pooling across tolerances. Endpoint differences do not imply monotonic change at intermediate confidence levels. M1 uses full sampling covariance in a crossed realization–hospital model; M2 uses only its diagonal; M3 aggregates repeated realizations before

hospital inference; and M4 evaluates one realization across hospitals. DY and CDY use all successful fits within each cell; SER conditions on definitive estimated decisions, and macro-SER equally averages only cells with nonzero definitive counts. Complete trajectories across all five confidence levels are shown in Supplementary Figure S1, with all 240 numerical profiles reported in Supplementary Table S7. b, Direction classifications for all 288 contrast-by-distribution-by-tolerance-by-metric comparisons between P95 and C95. C95 is a central-95%-interval rule corresponding approximately to a three-state probability rule with effective confidence 0.975 for the continuous predictive distributions considered here, apart from the NQ boundary convention. It therefore represents greater decision stringency rather than a separate model mechanism. Crosses indicate opposite interval-supported directions, filled circles indicate the same interval-supported direction, and open circles indicate that at least one contrast was compatible with zero. Classification is based on the 95% paired Monte Carlo intervals rather than rounded point estimates. Eleven classifications showed strict reversals. FQ-def conditions false qualification on definitive decisions; macro FQ-def uses equal weighting across defined cells. P95 remained the primary policy. The oracle was matched to the decision rule at each confidence level, and these related comparisons were not treated as independent replications.

P95 (c = 0.95). Each marker is one absolute macro profile; tolerances are not joined.

Paired strategy contrasts

Paired differences and 95% Monte Carlo intervals: comparison minus reference

All 3 DGPs × 4 tolerances × 4 metrics in each contrast. Open markers: MC interval includes zero. Common-success N: Table 3.
The sign indicates change in the named metric; it does not define a universal favorable direction.

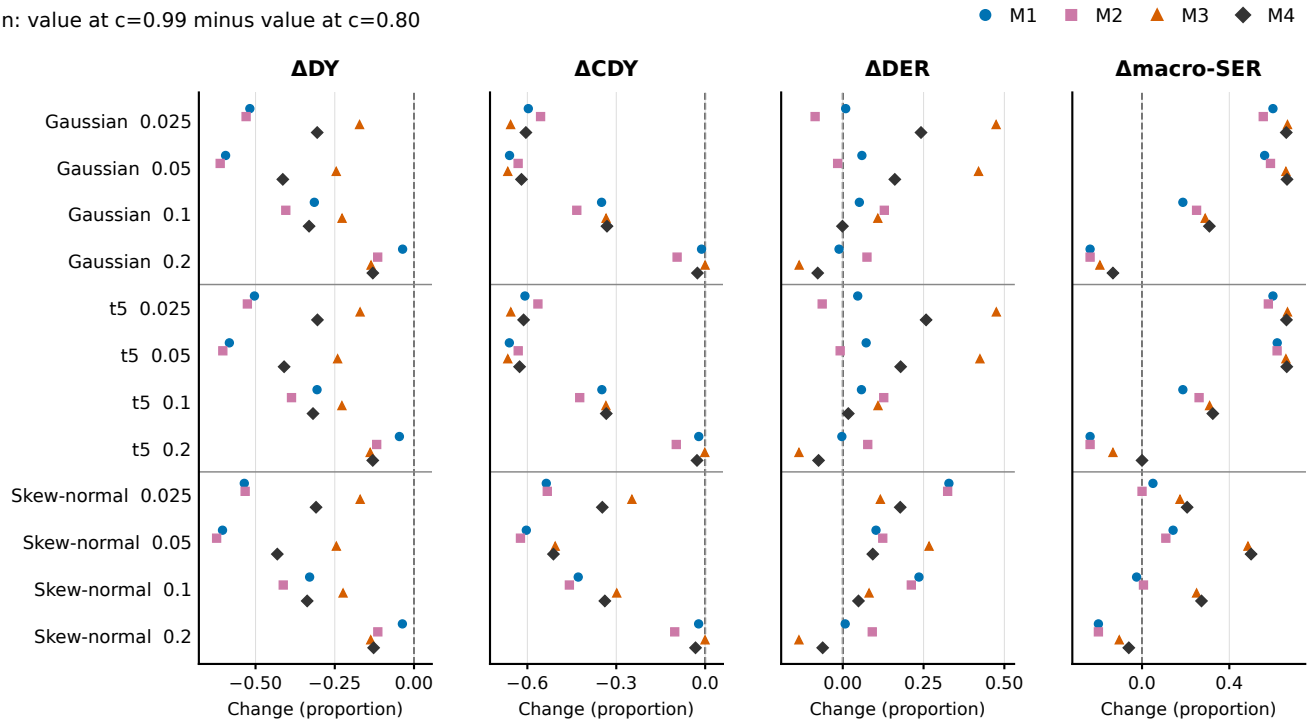

Dashed outline: <0.90. Solid outline: >0.99. Descriptive concentration thresholds, not inferential calibration cutoffs. Exact values: Table S5 and Figure 4 source data.
R1 realization-dominant; R2 hospital-dominant; R3 interaction-dominant; R4 mixed.

Decision-stringency sensitivity

a) Change from c=0.80 to c=0.99

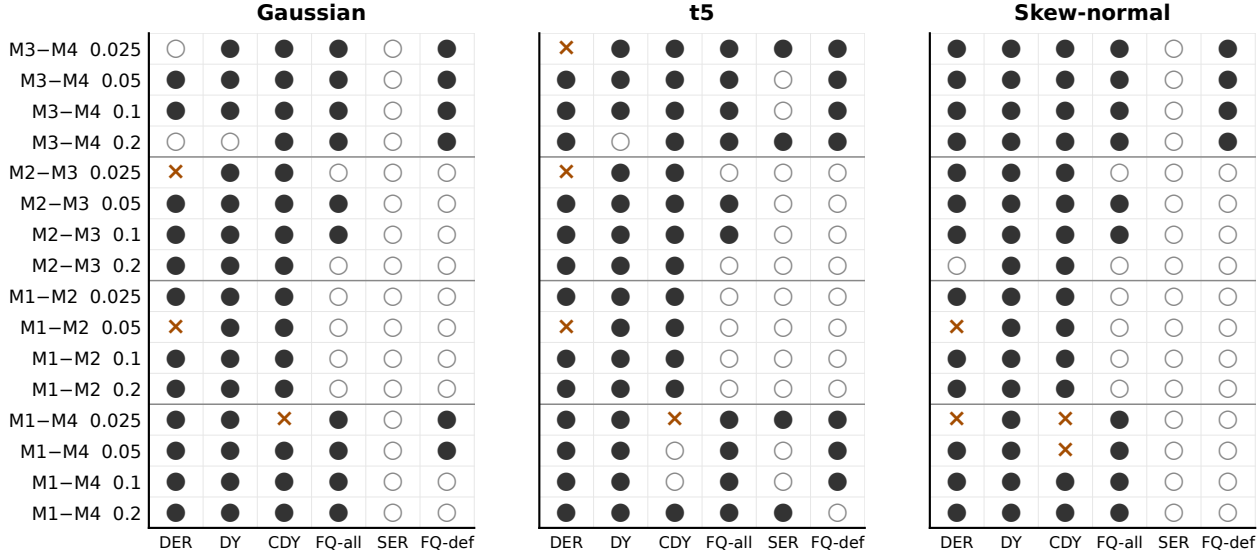

Sign: value at c=0.99 minus value at c=0.80

Rows: DGP and δ. All 48 endpoint changes per metric; full trajectories: Figure S1.

b) Strategy-contrast sensitivity to stricter decision stringency

P95: c=0.95. C95: a central-95%-interval representation of an approximately c=0.975 tail criterion, apart from boundary convention.

× Strict interval-supported reversal ● Same interval-supported direction

○ At least one null-compatible interval. All 288 classifications are shown.

SER and FQ-def are macro means. Related scenarios are not independent replications.

Supplementary Table S1 — Complete absolute decision metrics

The long table contains all six primary and conditional metrics for every P95 profile, with Monte Carlo intervals and defined-cell counts. SER and FQ-def denominator counts are definitive decisions; all other displayed rates use successful fits. Subpart B contains the complete worked-example cells.

Common settings: Policy = P95; c = 0.95; Macro weighting = Equal weight across 24 template-regime cells.

Supplementary Table S1B — Complete absolute decision metrics

The long table contains all six primary and conditional metrics for every P95 profile, with Monte Carlo intervals and defined-cell counts. SER and FQ-def denominator counts are definitive decisions; all other displayed rates use successful fits. Subpart B contains the complete worked-example cells.

Common settings: DGP = G; δ = 0.05; Strategy = M1; Policy = P95; c = 0.95.

Supplementary Table S2 — M1 qualification capability

Each of the six diagnostics retains numerator, denominator, value and estimability. Zero oracle-Q or estimated-Q denominators remain NOT ESTIMABLE. Small tolerances without oracle-qualified cases do not estimate qualification sensitivity.

These diagnostics are secondary reporting measures, not primary endpoints.

The estimated qualification rate and estimated indeterminate rate were estimable in every row.

Numeric-estimate cells remain blank when undefined; the corresponding estimate-with-estimability column explicitly identifies those cases as NOT ESTIMABLE.

Common settings: Strategy = M1; Policy = P95; c = 0.95; Qualified false rejection numerator N = 0.

Row numbers correspond across column groups.

Supplementary Table S3 — Complete paired strategy contrasts

All six paired metrics use comparison minus reference. The common-success set is paired within cell; conditional metrics further require positive definitive denominators in both strategies. Cells denotes contributing cells. Intervals quantify Monte Carlo uncertainty.

Common settings: Policy = P95; c = 0.95.

Row numbers correspond across column groups.

Supplementary Table S5 — Complete coverage-cell results

All 576 cells report attempted, successful and covered counts, coverage, width, pointwise Monte Carlo limits and fitted/true variance diagnostics. Missing realization or interaction variance in M3/M4 outputs denotes an unrepresented component and is not replaced with a numerical zero.

Common settings: Attempted fits N = 1000; Nominal = 0.95.

Row numbers correspond across column groups.

Supplementary Table S6 — Coverage concentration

Coverage below 0.90 or above 0.99 is summarized by the listed dimension. These are descriptive counts; different aggregation dimensions overlap and should not be summed.

Supplementary Table S7 — Complete confidence-grid results

The primary subpart contains all 240 confidence profiles, and subpart B contains the endpoint changes c=0.99 minus c=0.80. Trajectories keep δ fixed. Conditional macro rates retain their own denominator scope.

Supplementary Table S8 — Decision-stringency direction sensitivity

The primary subpart contains all 288 P95/C95 paired classifications, estimates, Monte Carlo limits and common-success denominators. Subpart B contains all 96 absolute profiles. C95 represents stricter decision stringency near c=0.975, not a separate model component. Classification reflects the interval-supported direction of each paired contrast.

Row numbers correspond across column groups.

Supplementary Table S8B — Decision-stringency direction sensitivity

The primary subpart contains all 288 P95/C95 paired classifications, estimates, Monte Carlo limits and common-success denominators. Subpart B contains all 96 absolute profiles. C95 represents stricter decision stringency near c=0.975, not a separate model component. Classification reflects the interval-supported direction of each paired contrast.

Row numbers correspond across column groups.

Supplementary Table S9 — H200 included and excluded hospital descriptors

All available hospital-level descriptors are reported, including medians, quartiles and extrema. No age/sex values or group P values are supplied. The event-rate distribution is across hospitals and differs from an admission-weighted event proportion.

Hospital descriptors are presented descriptively; no between-group P values were calculated. All listed descriptors were available.

Row	H200 group	Hospitals N	Descriptor	Median	25th percentile	75th percentile	Minimum	Maximum

Supplementary Table S10A — Cohorts and measurement representation

Subpart A contains the clinical cohorts, B the physiology mappings and valid ranges, and C demographic coding. Endpoint ascertainment remains database-specific. BUN conversion is physical unit/chemical-scale conversion and does not establish assay equivalence.

Common settings: Prediction landmark = 24 h after ICU admission.

Row	Database	Version	Role	Analytic N	Events N	Endpoint
1	MIMIC-IV	3.1	Source training	40745	2358	7-day post-landmark all-cause mortality
2	MIMIC-IV	3.1	Held-out internal evaluation	10187	590	7-day post-landmark all-cause mortality
3	SICdb	1.0.8	External evaluation	12294	548	7-day post-landmark all-cause mortality
4	eICU-CRD	2.0	Multicenter external evaluation	104322	6391	Bounded 7-day post-landmark in-hospital mortality proxy

Supplementary Table S10B — Cohorts and measurement representation

Subpart A contains the clinical cohorts, B the physiology mappings and valid ranges, and C demographic coding. Endpoint ascertainment remains database-specific. BUN conversion is physical unit/chemical-scale conversion and does not establish assay equivalence.

Common settings: Source timestamp type = absolute charttime; Window = [0,24 h); Value summaries = first;last;minimum;maximum;median; Observation descriptors = Any observation; observed-hour density.

Row numbers correspond across column groups.

20	no	offset-seconds	lab (lab_events)
21	no	offset-seconds	lab (lab_events)

Supplementary Table S10B — Cohorts and measurement representation

Row numbers correspond across column groups.

Row	eICU source field or label	eICU offset field	eICU unit	eICU conversion	eICU source priority	Accepted minimum	Accepted maximum
1	heartrate	observationoffset	bpm	none	single source	10	300
2	systemicsystolic / noninvasivesystolic	observationoffset	mmHg	none	invasive (systemicsystolic) primary; noninvasivesystolic fallback only if invasive fully absent in [0,1440)	20	300
3	systemicdiastolic / noninvasivediastolic	observationoffset	mmHg	none	invasive primary; noninvasive fallback	5	225
4	systemicmean / noninvasivemean	observationoffset	mmHg	none	invasive primary; noninvasive fallback	10	250
5	respiration	observationoffset	breaths/min	none	single source	1	80
6	sao2	observationoffset	%	none	single source	20	100
7	temperature	observationoffset	C	none (source already Celsius)	single source	25	45
8	WBC x 1000	labresultoffset	x1000/uL	none	single accepted label	0	200
9	Hgb	labresultoffset	g/dL	none	single accepted label	2	25
10	platelets x 1000	labresultoffset	x1000/uL	none	single accepted label	1	2000
11	creatinine	labresultoffset	mg/dL	none	single accepted label	0.1	30
12	BUN	labresultoffset	mg/dL	none	single accepted label	1	250
13	sodium	labresultoffset	mEq/L	none	single accepted label	90	200
14	potassium	labresultoffset	mEq/L	none	single accepted label	1	10
15	glucose	labresultoffset	mg/dL	none	lab-drawn glucose only	10	2000
16	bicarbonate	labresultoffset	mEq/L	none	directly-measured serum bicarbonate only	2	60
17	chloride	labresultoffset	mEq/L	none	single accepted label	50	200
18	lactate	labresultoffset	mmol/L	none	single accepted label	0.1	30
19	pH	labresultoffset	pH units	none	Generic pH used as arterial-context proxy; specimen source not explicitly identified	6.5	8.0
20	paO2	labresultoffset	mmHg	none	label explicitly arterial	10	700
21	paCO2	labresultoffset	mmHg	none	label explicitly arterial	5	200

Supplementary Table S10C — Cohorts and measurement representation

Subpart A contains the clinical cohorts, B the physiology mappings and valid ranges, and C demographic coding. Endpoint ascertainment remains database-specific. BUN conversion is physical unit/chemical-scale conversion and does not establish assay equivalence.

Common settings: eICU source table = patient; eICU offset field = n/a (static).

Row	Variable	eICU source field or label	eICU unit	eICU conversion	eICU source priority
1	age	age	years	Numeric age; top-coded >89 represented as 90	primary=90 for top-code
2	sex	gender	n/a	'Male'->1, else 0 (renamed to sex_male)	single source

Supplementary Table S11 — Generator and learner specifications

Each record is a model–parameter pair. Values describe the fitted specifications; no external-evaluation tuning is implied.

Row	Model	Parameter	Value
1	GaussianCopula	implementation	SDV
2	GaussianCopula	hyperparameters	SDV defaults (no tunable hyperparameters for this synthesizer)
3	GaussianCopula	default_distribution	beta (SDV default for GaussianCopulaSynthesizer)
4	CTGAN	epochs	300
5	CTGAN	batch_size	500
6	CTGAN	generator_dim	[256, 256]
7	CTGAN	discriminator_dim	[256, 256]
8	CTGAN	embedding_dim	128
9	CTGAN	generator_lr	0.0002
10	CTGAN	discriminator_lr	0.0002
11	TabDDPM	n_epochs	100
12	TabDDPM	num_timesteps	1000
13	TabDDPM	d_layers	[256, 256]
14	TabDDPM	optimizer	AdamW
15	TabDDPM	lr	0.001
16	TabDDPM	weight_decay	0.0001
17	TabDDPM	ema_decay	0.999
18	TabDDPM	diffusion_noise_schedule	cosine
19	TabDDPM	optimizer_lr_schedule	linear_decay_over_actual_updates
20	TabDDPM	sampling_weights	Final non-EMA checkpoint
21	TabDDPM	numeric_normalization	QuantileTransformer(output_distribution=normal)
22	TabDDPM	n_synthetic	40745
23	LR	penalty	l2
24	LR	C	1.0
25	LR	max_iter	5000
26	LR	solver	lbfgs
27	LR	class_weight	None
28	LR	preprocessing	StandardScaler fit on each training artifact only
29	XGBoost	n_estimators	200
30	XGBoost	max_depth	5
31	XGBoost	learning_rate	0.05
32	XGBoost	min_child_weight	1
33	XGBoost	subsample	0.8
34	XGBoost	colsample_bytree	0.8
35	XGBoost	eval_metric	logloss
36	XGBoost	random_state	42
37	XGBoost	n_jobs	4
38	Prediction	n_features	107
39	Generation	outcome_conditioning	false

Supplementary Table S12 — Oracle by estimated decision confusion matrices

Each record contains all nine oracle-to-estimated state counts, total evaluable fits and margins. Rows pool descriptive counts over cells and do not define macro metrics. Q, qualified; NQ, not qualified; I, indeterminate.

Counts are pooled descriptively across cells and do not represent the macro estimand.

Common settings: Policy = P95; c = 0.95.

Row numbers correspond across column groups.

Row	DGP	Distribution	δ	Strategy	Q → Q N	Q → NQ N	Q → I N	NQ → Q N	NQ → NQ N	NQ → I N	I → Q N	I → NQ N	I → I N	Total evaluable N	Oracle Q N	Oracle NQ N	Oracle I N	Estimated Q N	Estimated NQ N	Estimated I N

Supplementary Table S13B — Hospital population models and decisions

Row numbers correspond across column groups.

Row	Hospital variance share	Interaction variance share	Target A interval lower	Target A interval upper	Target B interval lower	Target B interval upper	m_{eq}	δ	Policy	c	Pr(Target B EUL ≤ δ)	Target B decision
44	0.483521311796	0.303132562604	0.0811453272026	0.154451823047	0.0658604726387	0.169736677611	2	0.05	C95	0.975	0.00525649417273	Not qualified

Supplementary Table S14 — Variance parameter estimates and intervals

Point estimates, successful bootstrap counts and 2.5th/97.5th percentiles are reported for the mean and variance parameters, including variance shares. Inference is conditional on V_h.

Inference was conditional on the estimated within-hospital sampling covariance V_h; no numerical boundary flags were observed.

Relative interval width is interval width divided by the absolute point estimate; it is undefined for a zero point estimate.

Supplementary Table S15 — Variance shares and variance-equivalence uncertainty

The combined table reports variance shares, bootstrap summaries, model-based m_{eq} and predictive interval comparisons. Subpart B reports finite, unbounded and boundary counts. m_{eq} is descriptive and does not select a replicate count.

All reported point-estimation fits were successful. The variance-equivalence quantity m_{eq} is descriptive and model-based; all point estimates were finite, with no unbounded or boundary variance-equivalence cases.

Bootstrap successes and failures are reported separately.

Common settings: Hospital population = H200; Hospitals N = 85; Admissions total = 84628; Events total = 5495; Non-events total = 79133; Attempted fits N = 1000.

Row numbers correspond across column groups.

Supplementary Table S15B — Variance shares and variance-equivalence uncertainty

The combined table reports variance shares, bootstrap summaries, model-based m_{eq} and predictive interval comparisons. Subpart B reports finite, unbounded and boundary counts. m_{eq} is descriptive and does not select a replicate count.

All variance-equivalence bootstrap summaries were finite; no unbounded or boundary cases occurred. The variance-equivalence quantity m_{eq} is descriptive and model-based.

Row	Template	Successful fits N	Finite bootstrap estimates N	2.5th percentile	Median	97.5th percentile

6	TabDDPM–XGBoost	999	999	2.0	5.0	12.0

Supplementary Table S16 — Generation reliability

The denominator is all generation attempts. Exact 95% binomial intervals are reported. Utility estimability is distinct from suitability.

Common settings: Generation attempts N = 15.

Row	Generator	Utility-estimable generations N	Failed generations N	Generation success probability	Exact 95% CI lower	Exact 95% CI upper
1	CTGAN	15	0	1.0	0.7819806390891612	1.0
2	GaussianCopula	15	0	1.0	0.7819806390891612	1.0

Supplementary Table S17 — Operational suitability

The product of generation probability and conditional Target-B utility probability is secondary and exploratory. The two factors and relevant generation counts remain explicit.

This analysis was secondary and exploratory. Operational suitability was calculated as Pr(utility-estimable generation) × Pr(Target B EUL ≤ δ | utility-estimable generation); this probability decomposition does not require an independence assumption.

The hospital population was H200, the future-use estimand was Target B, and each generator had 15 generation attempts.

Row	Generator	Learner	δ	Utility-estimable generations N	Failed generations N	Generation success probability	Exact 95% CI lower	Exact 95% CI upper	Pr(Target B EUL ≤ δ | utility-estimable generation)	Operational suitability probability

Supplementary Table S18A — Fit accounting and four-strategy common-success sensitivity

Subpart A gives simulation fit accounting, B the complete four-strategy common-success sensitivity analysis across all decision rules and metrics, and C bootstrap fit accounting. N is a fit count, not a patient count. Undefined metrics remain blank.

No estimation-instability flags occurred in the reported fits. Failed-fit counts are reported explicitly.

Common settings: Attempted fits N = 1000.

Supplementary Table S18B — Fit accounting and four-strategy common-success sensitivity

Subpart A gives simulation fit accounting, B the complete four-strategy common-success sensitivity analysis across all decision rules and metrics, and C bootstrap fit accounting. N is a fit count, not a patient count. Undefined metrics remain blank.

Common settings: Macro weighting = Equal weight across 24 template-regime cells; Sensitivity population = Four-strategy common-success set.

Supplementary Table S18C — Fit accounting and four-strategy common-success sensitivity

Subpart A gives simulation fit accounting, B the complete four-strategy common-success sensitivity analysis across all decision rules and metrics, and C bootstrap fit accounting. N is a fit count, not a patient count. Undefined metrics remain blank.

No estimation-instability flags occurred in the reported fits. Failed-fit counts are reported explicitly.

Common settings: Attempted fits N = 1000.

Row	Template	Successful fits N	Failed fits N	Failure rate
1	CTGAN–LR	1000	0	0.0
2	CTGAN–XGBoost	999	1	0.001
3	GaussianCopula–LR	1000	0	0.0
4	GaussianCopula–XGBoost	996	4	0.004
5	TabDDPM–LR	996	4	0.004
6	TabDDPM–XGBoost	999	1	0.001

4.000000	0.400000	M1_FULL_COV_CROSSED	1000	0	0.277341	0.001419	[-0.000547, 0.003384]
4.000000	0.400000	M2_DIAGONAL_COV_CROSSED	995	5	0.277341	0.000713	[-0.000684, 0.002110]
4.000000	0.400000	M3_REALIZATION_AGGREGATED	1000	0	0.277341	0.512870	[0.493185, 0.532556]
4.000000	0.400000	M4_SINGLE_REALIZATION	1000	0	0.277341	0.344785	[0.324550, 0.365020]

Rows 1–12 of 12; display-only rounding; full precision retained in authoritative CSV files.

Supplementary Table S21 — Illustrative scenario-conditional regret

B Paired M2-M3 regret contrast for the same scenario

Skew-normal heterogeneity; TabDDPM-XGBoost; realization-dominant regime; delta=0.20; p*=0.277341. Positive values indicate higher M2 regret.

a	b	Common-success N	p*	M2-M3 regret	95% MC interval	R2 interpretation
0.25	0.1	995	0.277341	0.000678	[0.000398, 0.000958]	M2 higher regret
0.25	0.2	995	0.277341	0.000000	[0.000000, 0.000000]	Deterministic equality on all common-success fits
4	0.4	995	0.277341	-0.512596	[-0.532339, -0.492852]	M2 lower regret

The source production table used an interval-includes-zero label for all intervals containing zero. R2 preserves the numerical record and distinguishes an exact [0,0] interval with zero replicate-level variance as deterministic equality. Supplementary Table S22 retains the source classification-count convention; Supplementary Data 8 preserves the source label and adds an explicit R2 interpretation field.

Supplementary Table S22 — E3 contrast classifications and fixed-P95 sensitivity

A Scenario-cell × cost interval-classification counts

analysis	contrast	COMPARISON_HIGHER_REGRET	COMPARISON_LOWER_REGRET	UNRESOLVED_INTERVAL_INCLUDES_ZERO
Cost-matched primary	M1_vs_M2_full_covariance	878	1653	6109
Cost-matched primary	M1_vs_M4_complete_strategy	367	5174	3099

Fixed-P95 sensitivity	M1_vs_M4_complete_strategy	1172	4904	2564
Fixed-P95 sensitivity	M2_vs_M3_crossed_structure	2886	2462	3292
Fixed-P95 sensitivity	M3_vs_M4_repeated_realization_information	1571	4973	2096

Rows 1–8 of 8; display-only rounding; full precision retained in authoritative CSV files.

Supplementary Table S22 — E3 contrast classifications and fixed-P95 sensitivity

B P95 sanity and failure accounting

record_type	agree_n	denominator_n	interpretation
Successful action comparisons at a=1,b=0.05	1151188	1151188	Valid Q/I/NQ actions
Failed-fit status preservation	812	812	FIT_FAILED retained separately; no action

Rows 1–2 of 2; display-only rounding; full precision retained in authoritative CSV files.

Supplementary Data titles and inventory

Supplementary Data 1

E1 real-trained AUROC. File: Supplementary_Data_01_E1A_REAL_TRAINED_BASELINE_AUROC.csv. Rows: 8.

Supplementary Data 2

E1 realization-level EUL summary. File: Supplementary_Data_02_E1B_REALIZATION_EUL_SUMMARY.csv. Rows: 12.

Supplementary Data 3

E1 empirical M1/M2/M3 decisions. File: Supplementary_Data_03_E1C_EMPIRICAL_M1_M2_M3_P95_DECISIONS.csv. Rows: 72.

Supplementary Data 4

E1 M4 realization decisions. File: Supplementary_Data_04_E1D_M4_REALIZATION_DECISIONS.csv. Rows: 352.

Supplementary Data 5

E1 hospital-population decisions. File: Supplementary_Data_05_E1E_H100_H200_H300_M1_TARGETB_DECISIONS.csv. Rows: 72.

Supplementary Data 6

E3 frozen cost grid. File: Supplementary_Data_06_E3_COST_GRID.csv. Rows: 30.

Supplementary Data 7

E3 scenario-conditional regret results. File: Supplementary_Data_07_E3_CONDITIONAL_REGRET_RESULTS.csv. Rows: 34560.

Supplementary Data 8

E3 paired strategy contrasts. File: Supplementary_Data_08_E3_PAIRED_STRATEGY_CONTRASTS.csv. Rows: 36000.

Supplementary Data 9

E3 fixed-P95 sensitivity. File: Supplementary_Data_09_E3_FIXED_P95_SENSITIVITY.csv. Rows: 69120.

Supplementary Data 10

E5 complete leave-one-generator-out results. File: Supplementary_Data_10_E5_LEAVE_ONE_GENERATOR_OUT_RESULTS.csv. Rows: 576.
